Our water system recently violated a drinking water standard. Although this incident was not an emergency, as our customers, you have a right to know what happened and what we did and are doing to correct this situation.

We routinely monitor for the presence of drinking water contaminants. Testing results from 01/01/2016 to 12/31/2016 show that our system exceeds the standard, or maximum contaminant level (MCL), for TTHM. The standard for TTHM is 80 µg/L. It is determined by averaging all the samples collected at each sampling location for the past 12 months. The level of TTHM averaged at one of our system’s sample locations for 01/01/2016 to 12/31/2016 was 80.66 µg/L.

**What should I do?**

- There is nothing you need to do. **You do not need to boil your water** or take other corrective actions.
- If you have a severely compromised immune system, have an infant, are pregnant, or are elderly, you may be at increased risk and should seek advice from your health care providers about drinking this water.

**What does this mean?**

This is not an emergency. If it had been an emergency, you would have been notified within 24 hours.

TTHM are four volatile organic chemicals which form when disinfectants, like chlorine, react with natural organic matter in the water.

*People who drink water containing trihalomethanes in excess of the MCL over many years may experience problems with their liver, kidneys, or central nervous system, and may have an increased risk of getting cancer.*
